

Qumulo & MimiQ: Avid™ Bin Locking for Shared Storage

Built to meet today's demanding workflows and massive content capacities, Qumulo's file data platform and Indiestor MimiQ provide a simple, open, end-to-end solution for media production with Avid™.

MimiQ by Indiestor is a simple Avid™-style bin locking utility for NAS environments. Qumulo's file data platform is an efficient, high performing file system that is easy to manage and scale, in both on-prem and cloud environments.

This joint solution enables post-production houses to leverage Qumulo's intelligent cloud-native file system amongst multiple users and provide bin-locking capabilities and collaboration for Avid™ workflows.

Project Collaboration and Fast and Easy Access to All Files

MimiQ solves key storage issues that plague every media production house. It runs on your taskbar, allowing multiple editors to collaborate using the same projects, bins, and media. Installation is a lightweight app for Intel-based Macs and PCs that runs client side, allowing for choice in storage, instead of being locked into proprietary local arrays.

Flexible File Data Platform to Meet Changing Production Requirements

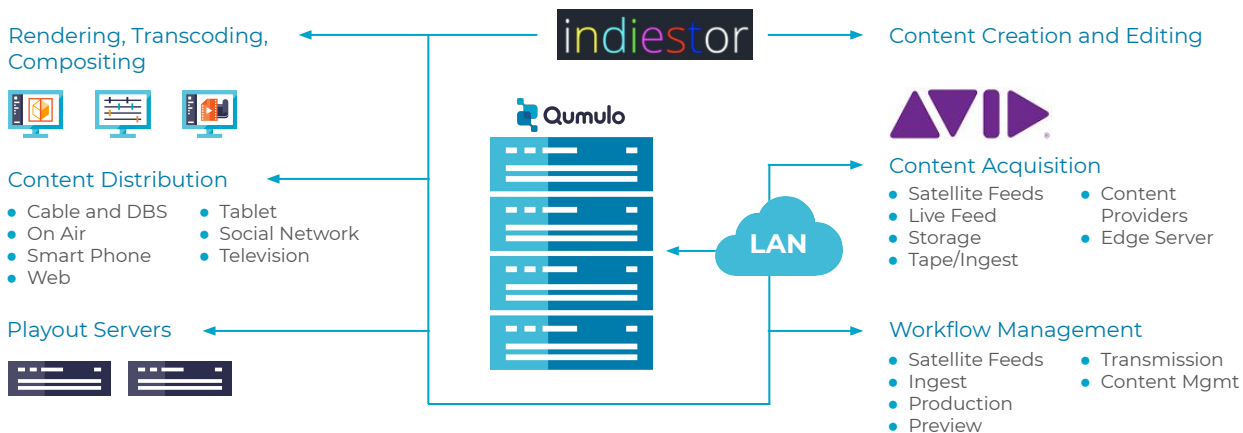

Instead of dedicated direct attached storage, MimiQ allows the use of shared scalable Qumulo file storage. This unlocks collaboration between Avid(™) editors and other production workflows without the need to constantly copy data back and forth between dedicated and shared storage. Share projects and assets among different users and applications seamlessly.
