Any Data, Any Location, Total Control

Cisco Solutions with Qumulo delivers the enterprise-class data services customers need to support and secure their SMB, NFS, and object-based workloads: exabyte scalability, multi-protocol access, cryptographically lockable snapshots, and quotas.

Why Cisco & Qumulo

The joint solution consolidates billions of files and petabytes-to-exabytes of unstructured data into a single, globally consistent namespace. This removes stranded data, giving AI systems instant access for more accurate models across workloads such as medical imaging, signals intelligence, autonomous driving, life sciences, geospatial mapping, video surveillance, and enterprise content.

Observability is another marquee workload. Qumulo's Data Platform streams OpenTelemetry directly into Splunk pipelines, enabling scalable deployments on Cisco UCS—from high-performance all-flash to cost-efficient HDD platforms. This turnkey approach simplifies rollout and provides a secure, reliable foundation for cybersecurity, situational awareness, and enterprise observability across environments.
